

1. Conditional Statements

Conditional statements allow a program to make decisions and execute different code paths based on whether a condition evaluates to true or false.

Evaluates a Boolean expression → executes the corresponding block.

2. If and Else If Statements

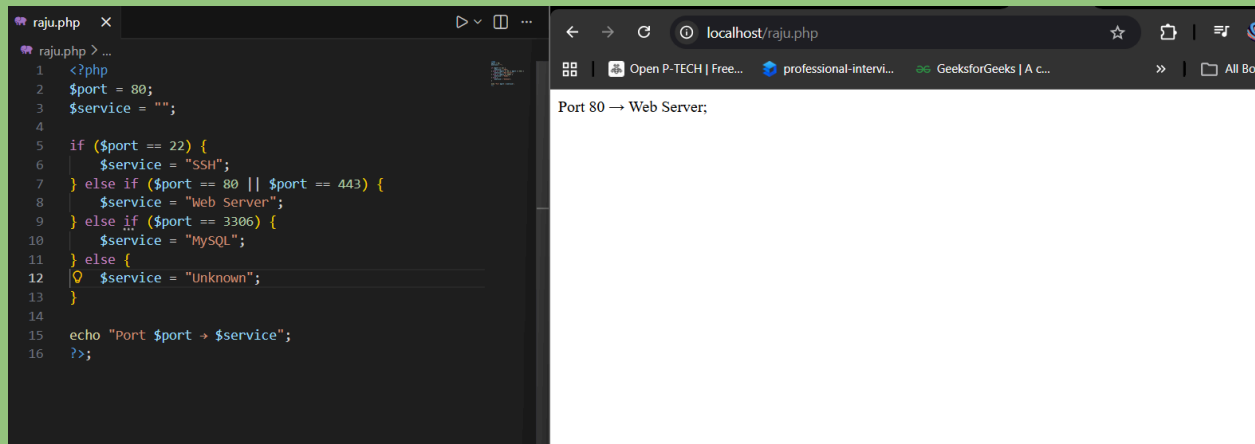

The most common conditional structure. if checks one condition; else if checks additional conditions; else handles all remaining cases.

Syntax (PHP):

```
if (condition1) {  
    // code  
} else if (condition2) {  
    // code  
} else {  
    // code  
}
```

Key Differences:

- if alone: single condition
- else if: multiple mutually exclusive conditions
- else: fallback

3. Switch Statements

Cleaner alternative to long if-else chains when comparing one variable against multiple constant values.

Syntax (PHP):

```
switch ($variable) {
```

```
case value1:
```

```
// code
```

```
break;
```

```
case value2:
```

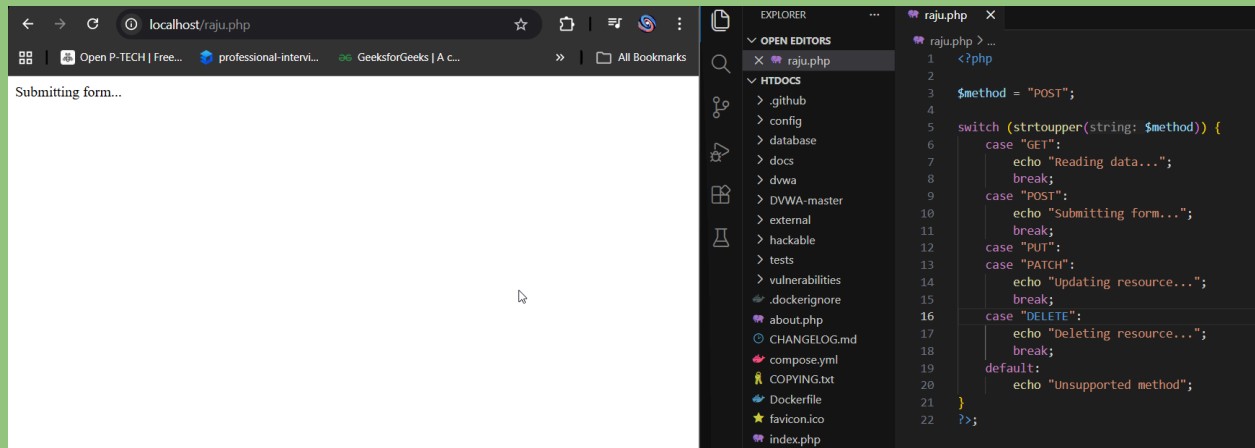

```
// code
```

```
break;
```

```
default:
```

```
// code
```

```
}
```

Difference between If-Else vs Switch:

- if-else → flexible (ranges, complex conditions, && ||)
- switch → best for exact value matching
- switch cannot easily handle ranges without multiple cases

4. Functions

Reusable block of code that performs a specific task. Promotes modularity and reduces repetition.

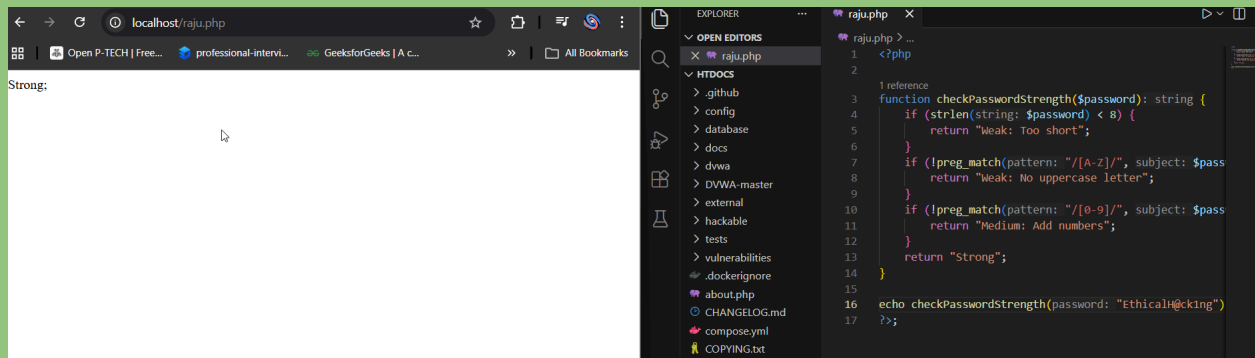

Benefits:

- Code reusability
- Easier debugging and maintenance
- Parameter passing & return values

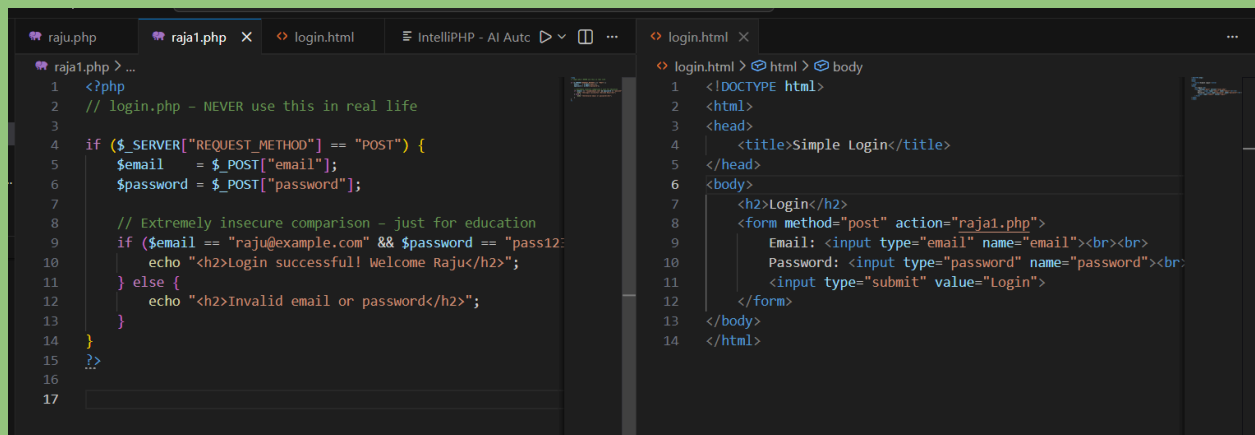

Types:

- Built-in (e.g., strlen(), hash())
- User-defined

PHP Function Example (Password Strength Checker):

5. Login Functionality using PHP

Output:
